cvilla@stevens.edu, jphan1@stevens.edu, bmartin5@stevens.edu, jlei7@stevens.edu

This document provides the requirements and design details of the PROJECT. The following table (Table 1) should be updated by authors whenever major changes are made to the architecture design or new components are added. Add updates to the top of the table. Most recent changes to the document should be seen first and the oldest last.

Table 1: Document Update History

Date	Updates
10/22/2025	JP, BM, JL, CV: <ul style="list-style-type: none">• Created GitHub Actions chapter 10)
10/17/2025	JP, BM, JL, CV: <ul style="list-style-type: none">• Updated Overleaf Docker host IP address. 1)

Chapter 1

Hosts

– Charles, Justin, Benedict, Jacky

Table 1.1: Hosts Table (Edited after Bugzilla Assignment)

Name	IP Address (or IP:Port)	OS	Job
devbox	10.0.0.10	Windows	Primary workstation used for coding and pushing commits to GitHub repositories.
database	10.0.0.11	Linux	Stores all persistent project data and connects to the backend API host.
testing	10.0.0.12	Linux	Dedicated environment for integration and regression testing prior to deployment.
api	10.0.0.13	Ubuntu 22.04	Backend REST API server responsible for serving requests between frontend and database.
Bugzilla Docker	174.138.69.132:8080	Ubuntu	Docker container hosting Bugzilla (public HTTP access via port 8080).
Overleaf Docker	159.65.44.227:80	Ubuntu	Overleaf Community Edition instance (public HTTP access on port 80).

Chapter 2

Passwords

– Charles, Justin, Benedict, Jacky

Table 2.1: Password Table

User / Account	Password (Hint)	Server Rules / Notes
bugzilla_admin	<KEY><N>@bugzilla	For the Bugzilla Docker container (174.138.69.132:8080). Follows the shared key rule format.
overleaf_maintainer	<KEY><N>@overleaf	For the Overleaf Docker container (159.65.44.227:80). Same structure as others for maintainability.
api_svc	<KEY><N>@api	Used by the backend API host (10.0.0.13).
db_admin	<KEY><N>@db	Used for the main database host (10.0.0.11).
devbox_admin	<KEY><N>@devbox	Used for the development workstation (10.0.0.10).
tester	<KEY><N>@testing	Used for the testing host (10.0.0.12).

Each password follows our shared group convention: a short English word beginning and ending with the same letter (<KEY>), followed by a number equal to twice the number of vowels in that word (<N>), and ending with the site tag. This system allows easy password rotation while keeping host associations clear and consistent.

Chapter 3

Linux Commands

– Charles, Justin, Benedict, Jacky

3.1 Part A: Navigation & File Ops

- 1:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % pwd
2 /Users/jackylei/lx-test
3
```

- 2:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % ls -la -lh
2 total 136
3 drwxr-xr-x@ 12 jackylei staff 384B Sep 15 16:56 .
4 drwxr-x---+ 58 jackylei staff 1.8K Sep 13 22:14 ..
5 -rw-r--r--@ 1 jackylei staff 6.0K Sep 15 16:53 .DS_Store
6 drwxr-xr-x@ 3 jackylei staff 96B Sep 15 16:52 archive
7 -rw-r--r--@ 1 jackylei staff 48K Sep 13 22:14 blob.bin
8 lrwxr-xr-x@ 1 jackylei staff 13B Sep 13 22:14 link-to-file1 -> src/
   file1.txt
9 -rw-r--r--@ 1 jackylei staff 0B Sep 15 16:56 notes.md
10 -rw-r--r--@ 1 jackylei staff 56B Sep 15 16:56 people.csv
11 drwxr-xr-x@ 5 jackylei staff 160B Sep 13 22:14 src
12 -rw-r--r--@ 1 jackylei staff 56B Sep 13 22:14 sys.log
13 drwxr-xr-x@ 3 jackylei staff 96B Sep 15 16:04 tmp
14 -rw-r--r--@ 1 jackylei staff 28B Sep 13 22:14 words.txt
15
```

- 3:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % [ -d tmp ] && cp -v src/
   file1.txt tmp
2 src/file1.txt -> tmp/file1.txt
3
```

- 4:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % mv -v old.txt archive/  
2 old.txt -> archive/old.txt  
3
```

- 5:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % touch notes.md  
2
```

- 6:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % du -h src  
2
```

3.2 Part B: Viewing & Searching

- 7:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % cat -n sys.log  
2      1  INFO boot ok  
3      2  WARN disk low  
4      3  ERROR fan fail  
5      4  INFO shutdown  
6
```

- 8:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % cat sys.log | grep "ERROR"  
2 ERROR fan fail  
3
```

- 9:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % grep -o -i '[:alnum:]]\+'  
      words.txt | sort -u | wc -l  
2          4  
3
```

- 10:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % cat words.txt | grep -i "g"  
2 Gamma  
3 gamma  
4
```

- 11:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % head -2 people.csv  
2 id,name,dept  
3 1,Ada,EE  
4
```

• 12:

```
1 (base) jackylei@Jackys-MacBook-Pro lx-test % tail -3 sys.log
2 WARN disk low
3 ERROR fan fail
4 INFO shutdown
5
```

3.3 Part C: Text Processing

• 13:

```
1 awk -F ',' 'NR > 1 {print $2}' people.csv
2
```

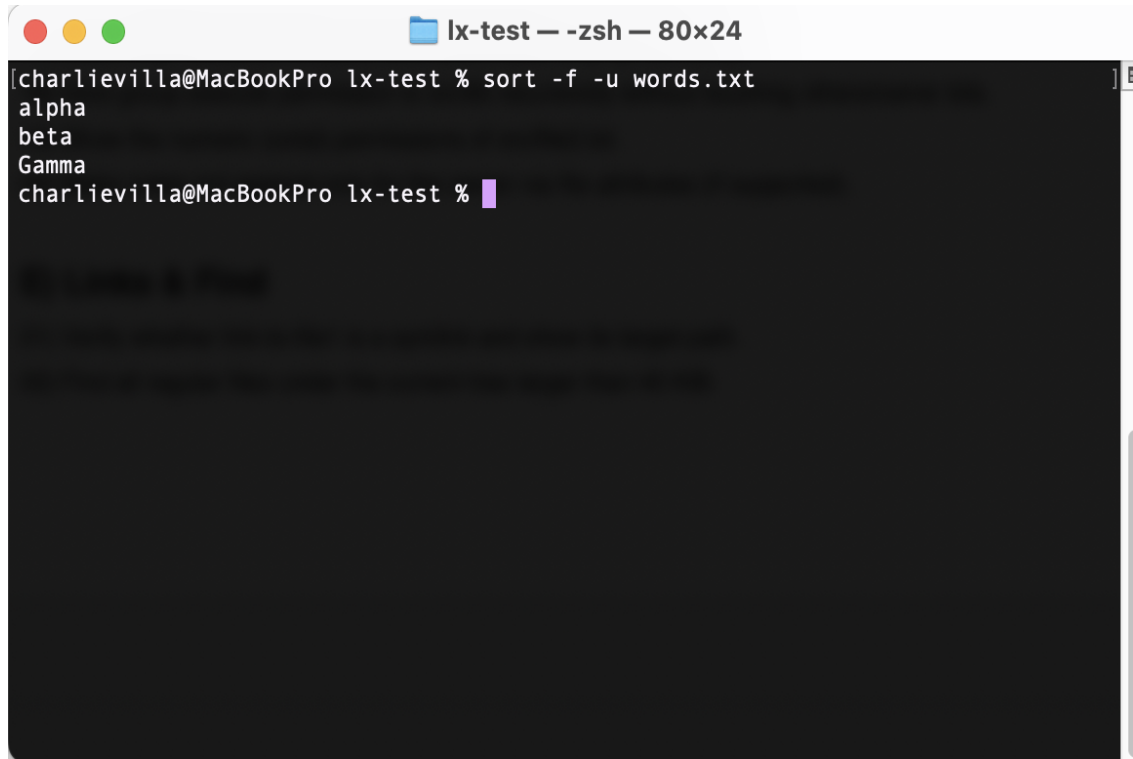

Figure 3.1: Part C #13 Terminal Output

• 14:

```
1 sort -f -u words.txt
2
```

```
lx-test — -zsh — 80x24
[charlievilla@MacBookPro lx-test % sort -f -u words.txt
alpha
beta
Gamma
charlievilla@MacBookPro lx-test %
```

Figure 3.2: Part C #14 Terminal Output

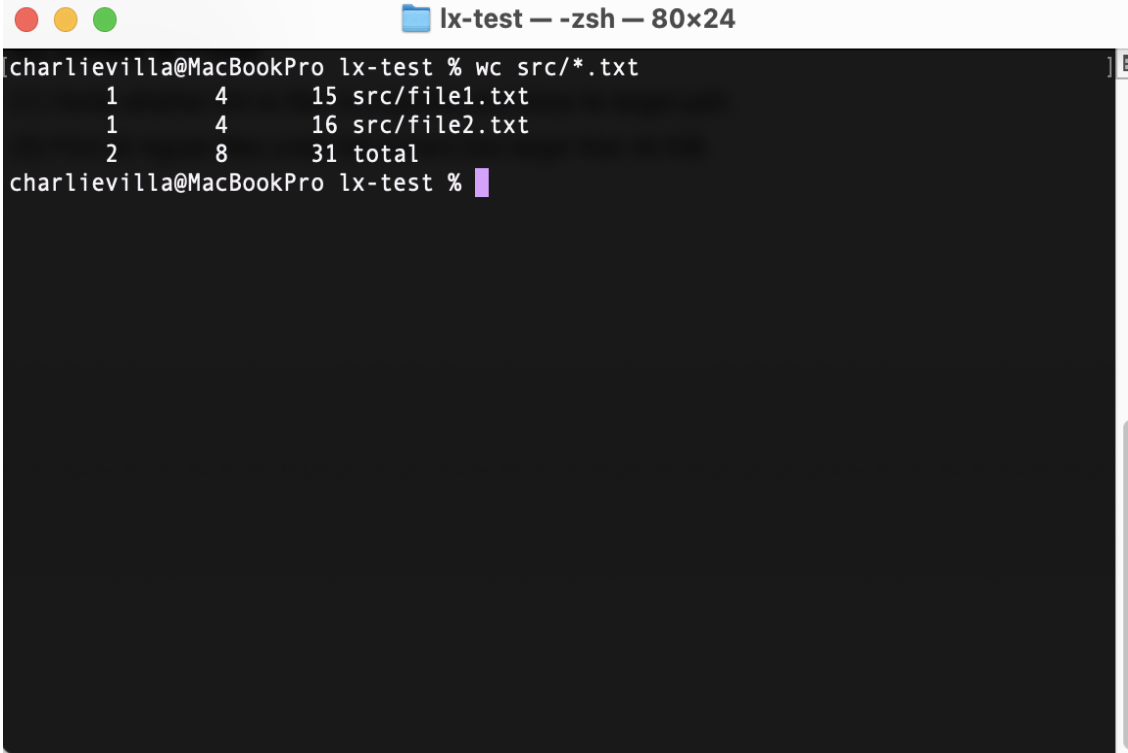

• 15:

```
1 find src/ -type f -exec sed -i .bak 's/three/3/g' {} +
2
```

No terminal output for question 15

• 16:

```
1 wc src/*.txt
2
```

```
charlievilla@MacBookPro lx-test % wc src/*.txt
  1      4     15 src/file1.txt
  1      4     16 src/file2.txt
  2      8     31 total
charlievilla@MacBookPro lx-test %
```

Figure 3.3: Part C #16 Terminal Output

3.4 Part D: Permissions & Ownership

- 17:

```
1 chmod 700 tmp/
2
```

No terminal output for question 17

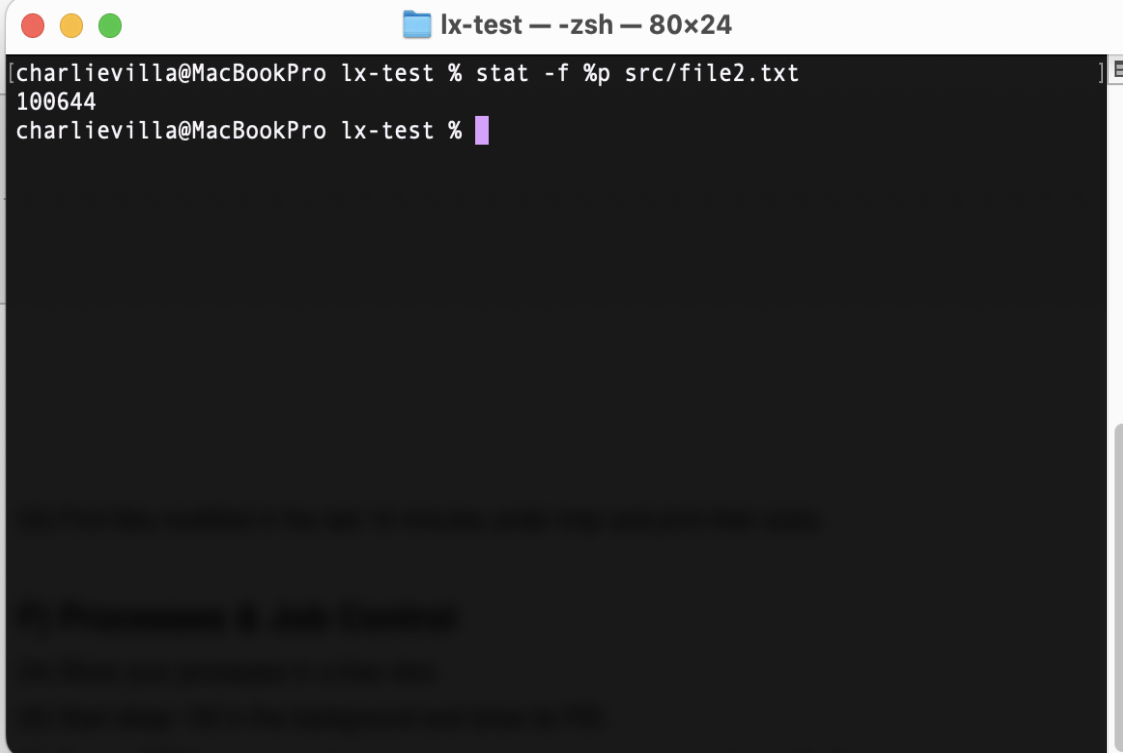

- 18:

```
1 chmod -R g+x src/lib
2
```

No terminal output for question 18

- 19:

```
1 stat -f %p src/file2.txt
2
```

A screenshot of a terminal window titled "lx-test — -zsh — 80x24". The window shows a command prompt "charlievilla@MacBookPro lx-test %". The user has entered the command "stat -f %p src/file2.txt". The output of the command is "100644". The prompt is now "charlievilla@MacBookPro lx-test %".

```
charlievilla@MacBookPro lx-test % stat -f %p src/file2.txt
100644
charlievilla@MacBookPro lx-test %
```

Figure 3.4: Part C #19 Terminal Output

- 20:

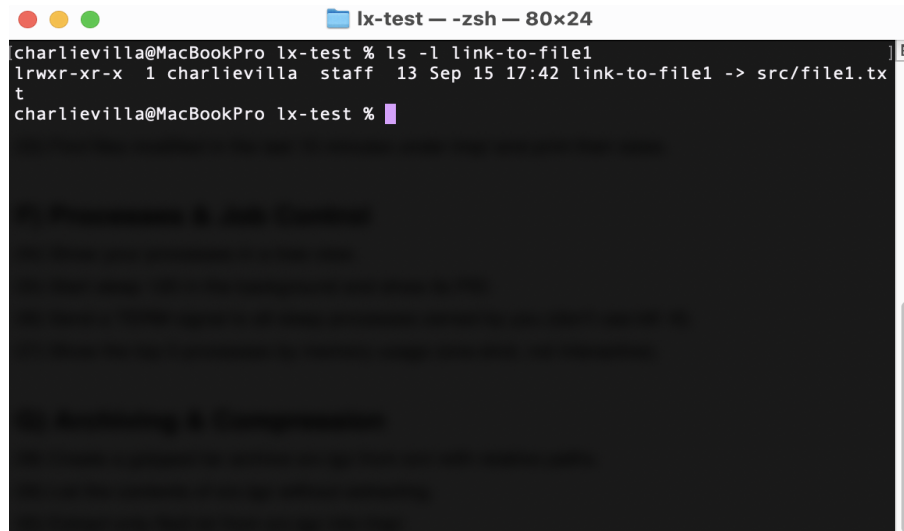

```
1 touch notes.md
2 chflags uappnd notes.md
3
```

No terminal output for question 20

3.5 Part E: Links & Find

- 21:

```
1 ls -l link-to-file1
2
```

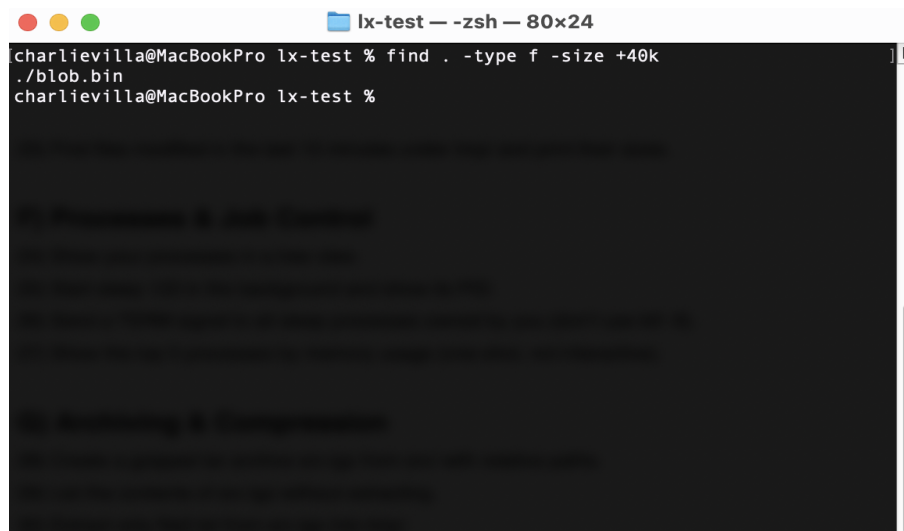

A terminal window titled 'lx-test --zsh-- 80x24' showing the command 'ls -l link-to-file1' and its output. The output is a single line: 'lrwxr-xr-x 1 charlievilla staff 13 Sep 15 17:42 link-to-file1 -> src/file1.txt'. The prompt is 'charlievilla@MacBookPro lx-test %'.

```
charlievilla@MacBookPro lx-test % ls -l link-to-file1
lrwxr-xr-x 1 charlievilla staff 13 Sep 15 17:42 link-to-file1 -> src/file1.tx
t
charlievilla@MacBookPro lx-test %
```

Figure 3.5: Part C #21 Terminal Output

• 22:

```
1 find . -type f -size +40k
2
```

A terminal window titled 'lx-test --zsh-- 80x24' showing the command 'find . -type f -size +40k' and its output. The output is './blob.bin'. The prompt is 'charlievilla@MacBookPro lx-test %'.

```
charlievilla@MacBookPro lx-test % find . -type f -size +40k
./blob.bin
charlievilla@MacBookPro lx-test %
```

Figure 3.6: Part C #22 Terminal Output

• 23:

```
1 touch tmp/some-new-file.txt
2 find tmp/ -type f -mmin -10 -exec stat -f "%z %N" {} +
3
```

Created a new file with "touch" because the tmp/ directory was empty before it.

```

lx-test — -zsh — 80x24
charlievilla@MacBookPro lx-test % touch tmp/some-new-file.txt
charlievilla@MacBookPro lx-test % find tmp/ -type f -mmin -10 -exec stat -f "%z
%N" {} +
0 tmp/some-new-file.txt
charlievilla@MacBookPro lx-test %

```

Figure 3.7: Part C #23 Terminal Output

3.6 Part F: Processes & Job Control

- 24: Tree View:

Chapter 4

Project Proposal

– Charles, Justin, Benedict, Jacky

Project Title: Dickey DevOps: A Luck-Based Probability Game

Project Description: Our project is a web-based luck game that also teaches concepts of probability and the idea of risk versus reward. Players will roll dice and place bets on different outcomes such as totals, pairs, triples, or exact numbers. They can choose to re-roll or lock dice, which adds strategic choices between safer but lower-value options and riskier plays with higher potential rewards. The game will also feature occasional "event rounds" where special conditions apply (such as bonus payouts or inverted win conditions). After each round, the game will provide insights into the actual probability of success and expected value, helping players better understand chance, statistics, and decision-making.

Sample tasks include designing the dice roll system with fair randomness, building a leader board to track high scores, and implementing "learning mode" features that explain probabilities to the player. Some tasks we have brainstormed include implementing the dice roll system, building a leader board, and creating a "learning mode" that explains probability insights to players. We will also design a dashboard to track both system health and game-related metrics such as win/loss ratios, re-roll usage, and outcome distributions.

For the DevOps side, we plan to use version control, testing, deployment pipelines, and monitoring tools. Examples may include GitHub for source control, Gitlab CI/CD pipelines to automate builds and deployments, PostgreSQL or another database for storing results, containerization with Docker, infrastructure as code tools for environment setup, and monitoring solutions such as Prometheus and Grafana. We are still discussing the exact tech stack as a team, but our goal is to keep the setup lightweight and easy to extend while still allowing us to compare multiple DevOps tools as required.

Chapter 5

AWS Deployment

– Charles, Justin, Benedict, Jacky

Live URL: <https://zjnbvfjpug.us-east-1.awsapprunner.com>

Overview

We deployed the *Two Buttons* website as a containerized service on AWS. The pipeline is:

1. Authenticate the AWS CLI via **SSO** (IAM Identity Center).
2. Build a Docker image locally and push it to **Amazon ECR**.
3. Deploy from ECR to a managed container runtime using **AWS App Runner**.

Why App Runner? For a small stateless web app, App Runner removes the need to manage ECS tasks/services, load balancers, or EC2 capacity. It auto-builds or pulls from ECR, provisions HTTPS and scaling, and exposes a public URL with minimal ops overhead (good for a course project).

Project root used for the build `C:\Users\benma\Documents\docker-examples-benedict\docker-examples\color-buttons-app`

Prerequisites

- Windows 10/11 with **Docker Desktop** and **AWS CLI v2**.
- **SSO** set up in the AWS Console (IAM Identity Center) with an AdminAccess permission set (temporary for the lab).
- Overleaf configured to compile with `minted` (shell escape enabled).

Authenticate the AWS CLI (SSO)

```
aws configure sso
aws sso login --profile default
aws sts get-caller-identity --profile default
# Confirm the returned Account ID is yours and an SSO role is assumed.
```

Build, Tag, and Push the Image to Amazon ECR

```
# Go to the project folder
cd "C:\Users\benma\Documents\docker-examples-benedict\docker-examples\color-buttons-app"

# Environment
$Env:AWS_REGION="us-east-1"
$Env:ECR_REPO="color-buttons-app"
$Env:IMAGE_TAG="v1"
$Env:AWS_ACCOUNT_ID=(aws sts get-caller-identity --query Account --output text
→ --profile default)

# Create the ECR repo if missing
aws ecr describe-repositories --repository-names $Env:ECR_REPO --region
→ $Env:AWS_REGION --profile default *> $null ; if ($LASTEXITCODE -ne 0) {
    aws ecr create-repository --repository-name $Env:ECR_REPO `
        --image-scanning-configuration scanOnPush=true `
        --region $Env:AWS_REGION --profile default
}

# Log in Docker to ECR
aws ecr get-login-password --region $Env:AWS_REGION --profile default |
    docker login --username AWS --password-stdin
→ "$($Env:AWS_ACCOUNT_ID).dkr.ecr.$($Env:AWS_REGION).amazonaws.com"

# Build, tag, and push (force linux/amd64 for App Runner build fleet
→ compatibility)
docker build --platform linux/amd64 -t "$($Env:ECR_REPO):$($Env:IMAGE_TAG)" .
docker tag "$($Env:ECR_REPO):$($Env:IMAGE_TAG)" `
    "$($Env:AWS_ACCOUNT_ID).dkr.ecr.$($Env:AWS_REGION).amazonaws.com/$($
→ Env:ECR_REPO):$($Env:IMAGE_TAG)"
docker push "$($Env:AWS_ACCOUNT_ID).dkr.ecr.$($Env:AWS_REGION).amazonaws.com/$($
→ Env:ECR_REPO):$($Env:IMAGE_TAG)"
```

Deploy with AWS App Runner (Console)

1. **Create service** → **Source:** *Container registry* → *Amazon ECR*.
Choose repository *color-buttons-app* and tag *v1*.

2. **Service name:** `color-buttons-app` **Port:** `3000`.
3. **ECR access role:** *Create new service role* (let App Runner pull from ECR).
4. **Health check:** HTTP on path `/` (timeout 5s, interval 10s).
5. Click **Create & Deploy**; wait for *Status: Running* and note the *Default domain*.

Verification

```
# Expect HTTP/2 200 (or similar)
curl -I https://zjnbvfjpug.us-east-1.awsapprunner.com
```

Manually verify the page renders and both buttons switch background color (blue/red).

Operating the Service (Logs, Scaling, Rollback)

- **Logs:** In App Runner → *Logs* tab to view system/app logs.
- **Scaling:** Default concurrency is 100 requests/instance, min 1, max 25 instances.
- **Re-deploy:** Push the same tag and choose *Actions* → *Deploy* for manual trigger services.
- **Rollback:** Keep prior image tags; re-point the service to the last known-good tag and redeploy.

Cost Guardrails & Cleanup

App Runner and ECR are pay-as-you-go. To avoid charges after grading:

1. In **App Runner:** *Actions* → *Pause* or *Delete* the service.
2. In **ECR:** delete the image(s) and (optionally) the repository.

(We also set an AWS Budget alarm earlier to notify on any unexpected spend.)

Figure

Class-based JavaScript Refactor

We replaced the old function-based handlers with an class that encapsulates all behavior (buttons, events, and background updates). Only the public assets changed (`public/index.html`, `public/app.js`); the server continues to serve `public/` and listen on `0.0.0.0:3000`.

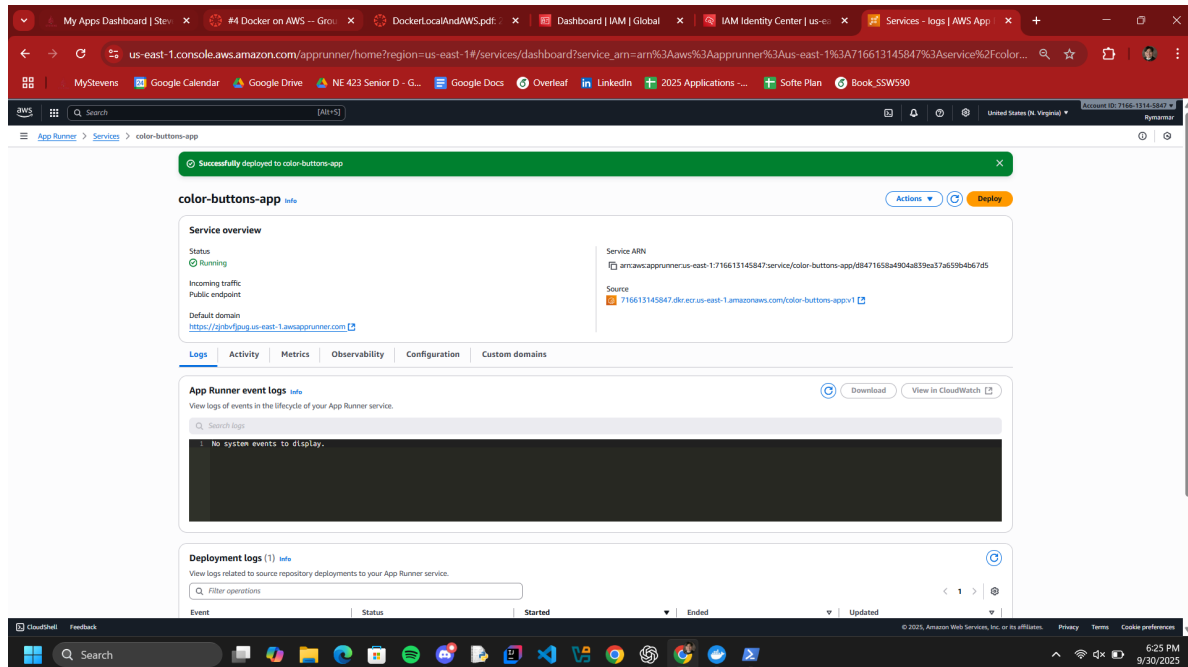

Figure 5.1: App Runner service in *Running* state with the default domain.

Updated public/index.html

```
<!doctype html>
<html lang="en">
<head>
  <meta charset="utf-8" />
  <title>Two Buttons</title>
</head>
<body>
  <h1>Two Buttons</h1>
  <button id="blueBtn">Blue</button>
  <button id="redBtn">Red</button>

  <script src="app.js"></script>
</body>
</html>
```

New public/app.js (class-based)

```
class ColorButtonsApp {
  constructor() {
    this.$blue = document.getElementById("blueBtn");
    this.$red = document.getElementById("redBtn");
    this.bindEvents();
  }
}
```

```

bindEvents() {
  this.$blue.addEventListener("click", () => this.setBg("steelblue"));
  this.$red .addEventListener("click", () => this.setBg("crimson"));
}
setBg(color) { document.body.style.backgroundColor = color; }
}
window.addEventListener("DOMContentLoaded", () => new ColorButtonsApp());

```

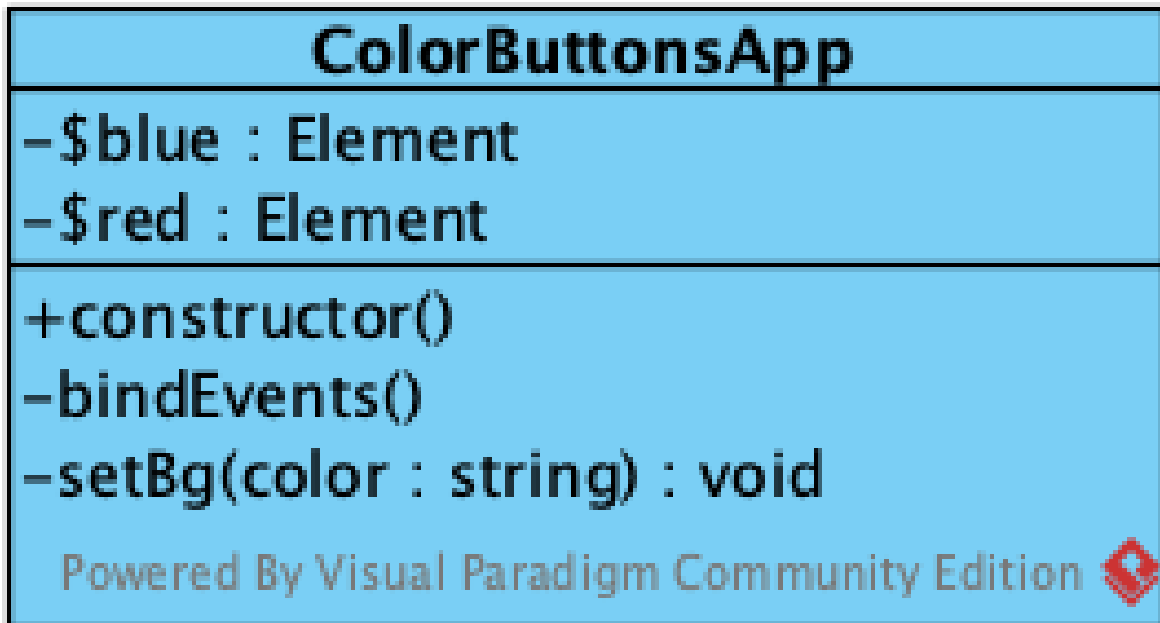

Figure 5.2: Class Diagram for App.js

Server.js

```

import express from "express";
import path from "path";
import { fileURLToPath } from "url";

const __filename = fileURLToPath(import.meta.url);
const __dirname = path.dirname(__filename);

const app = express();
const PORT = process.env.PORT || 3000;

// Serve static files from public/
app.use(express.static(path.join(__dirname, "public")));

app.listen(PORT, "0.0.0.0", () => {

```

```
console.log(`Server running at http://0.0.0.0:${PORT}!`);  
});
```

package.json

```
{  
  "name": "color-buttons-app",  
  "version": "1.0.0",  
  "type": "module",  
  "main": "server.js",  
  "scripts": {  
    "start": "node server.js"  
  },  
  "dependencies": {  
    "express": "^4.18.2"  
  }  
}
```

Result. Clicking **Blue** or **Red** now triggers methods on a single `ColorButtonsApp` instance, keeping the global scope clean and making the behavior easy to unit test or extend.

Chapter 6

LaTeX Docker

– Charles, Justin, Benedict, Jacky

6.0.1 Project Directory Setup

- Create a folder docker-latex
- Start docker
- Make sure docker is running by using `docker run hello-world`
- `cd` into that folder directory

6.0.2 Docker Commands

- Create a Dockerfile with the content below

```
FROM debian:bullseye-slim
```

```
ENV DEBIAN_FRONTEND=noninteractive
```

```
RUN apt-get update && \
    apt-get install -y \
        texlive-latex-base \
        texlive-latex-recommended \
        texlive-fonts-recommended \
        texlive-latex-extra \
        make \
        && apt-get clean && rm -rf /var/lib/apt/lists/*
```

```
WORKDIR /doc
```

```
CMD ["pdflatex", "main.tex"]
```

- Run `nano main.tex` and paste your desired LaTeX content
- Build the docker image

- Run the docker command
- Check your folder to see if the main.pdf file is created

```
nano main.tex  
docker build -t docker-latex .  
docker run --rm -v "$PWD":/doc docker-latex
```

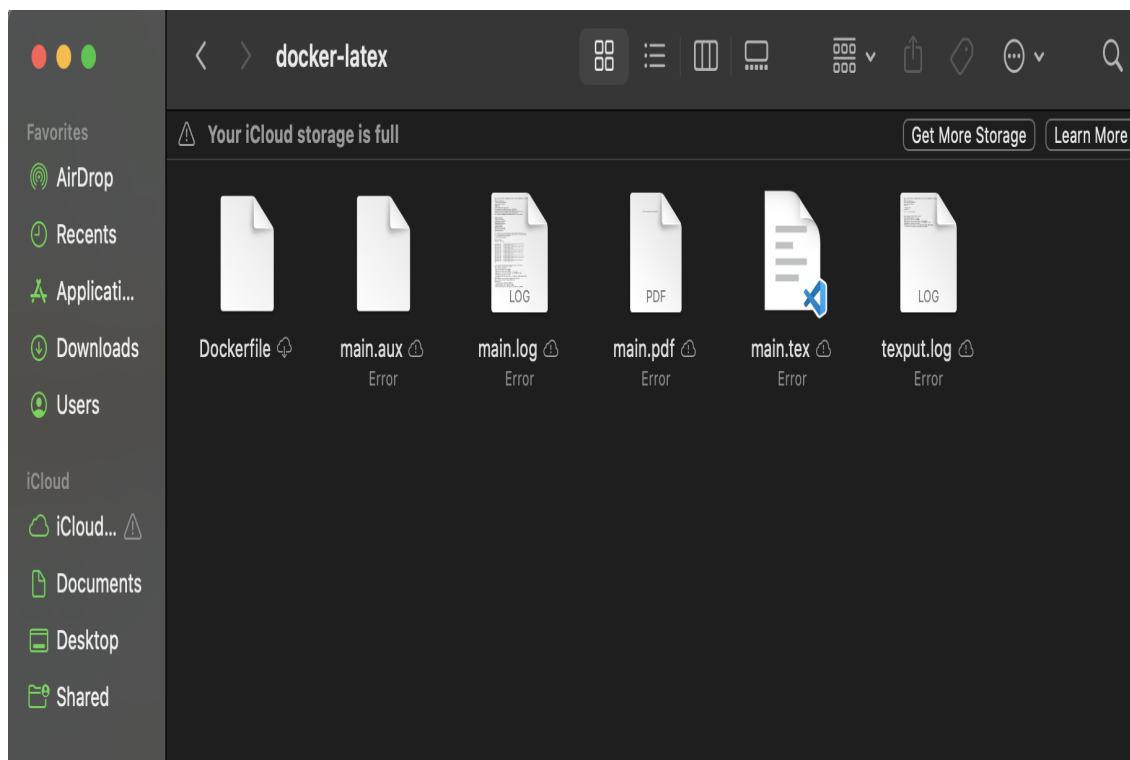

Figure 6.1: Folder containing files created from successful Docker build

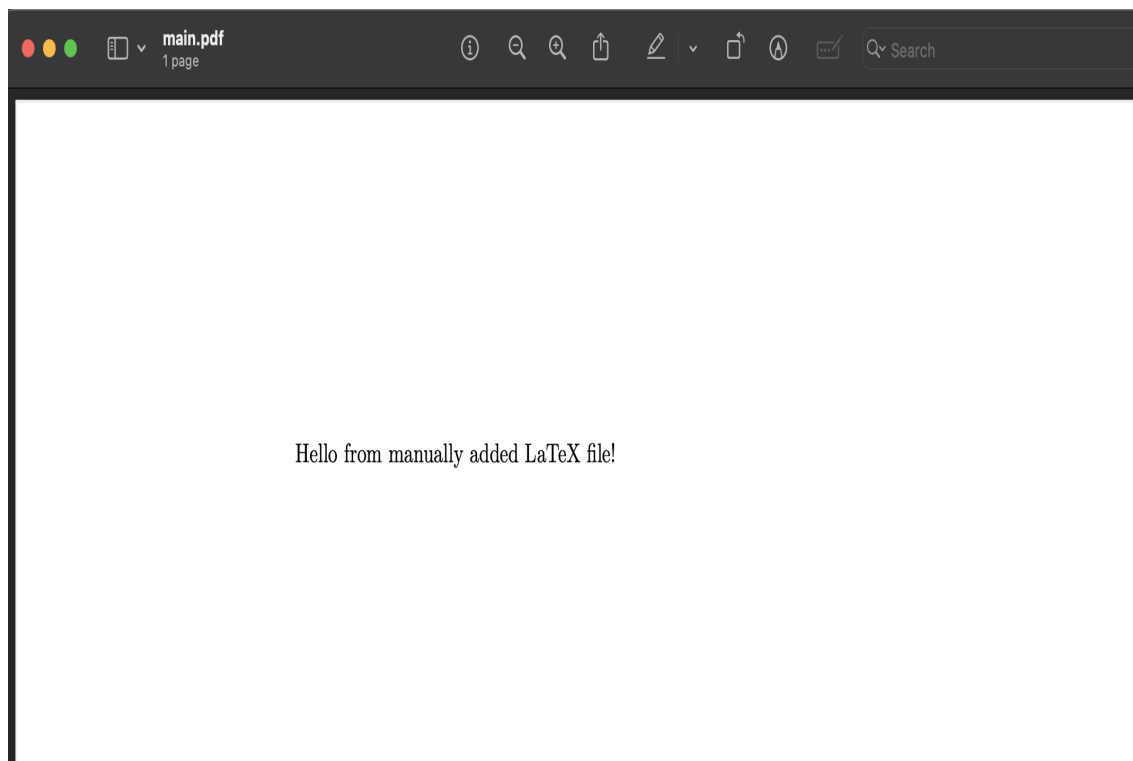

Figure 6.2: Docker compiled LaTeX document

Chapter 7

Bugzilla

– Charles, Justin, Benedict, Jacky

1. Setup Cloud Infrastructure and Access

- Created a Digital Ocean account and created a Ubuntu Droplet VM.
- Secured access by generating and adding an SSH key to the Droplet.

2. Prepare Container Environment

- Cloned the Bugzilla source code.
- Installed and fixed the missing dependencies (Docker Compose and the Docker service daemon) needed to run containers.

3. Deploy Application Containers

- Used Docker Compose to launch two linked services: the Bugzilla web application container and the MariaDB database container.
- Ensured the application's internal network port was mapped to the Droplet's external port 8080.

4. Finalize Configuration

- Executed the required Bugzilla setup script (checksetup.pl) inside the running web container to build the database schema and verify system readiness.

5. Access and Admin Creation

- Confirmed the application was accessible in a web browser at the public IP and port (<http://174.138.69.132.8080>).
- Completed the final step by creating the administrator account via the web interface.
- Deleted the Droplet (which is why the link might not work anymore) to avoid any unnecessary billing.

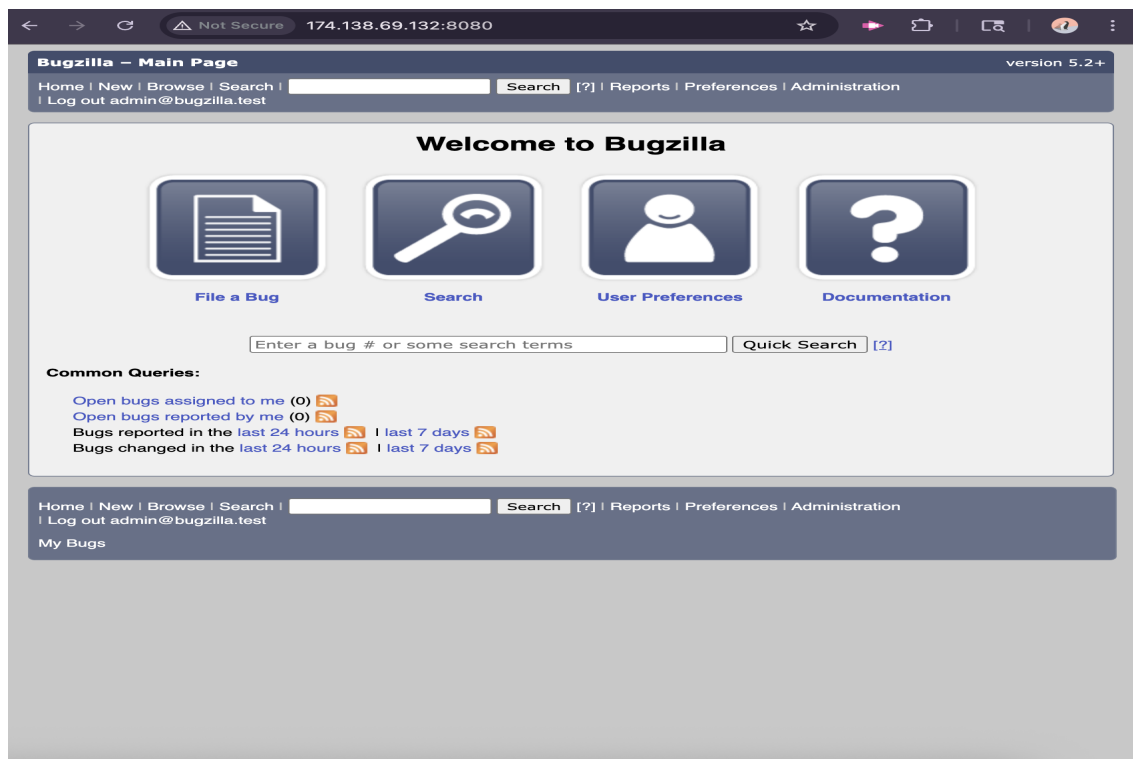

Figure 7.1: Bugzilla Container Running Screenshot

Chapter 8

Overleaf

– Charles, Justin, Benedict, Jacky

1. Setup Cloud Infrastructure and Access

- Created a Digital Ocean Droplet (VM) running Ubuntu.
- Secured access to the server by using the SSH protocol through the local terminal, which was made in the Bugzilla step.
- Resolved an initial SSH access issue to gain root privileges on the Droplet.

2. Prepare Container Environment

- Installed the necessary container tools (Docker Engine and Docker Compose V1), resolving dependency issues with the correct package name.
- Cloned the Overleaf Toolkit source code into the overleaf-ce directory.
- Edited the config/overleaf.tc file to set the application's public-facing address and listen on the appropriate IP/Port:
 - Set `OVERLEAF_LISTEN_IP=0.0.0.0` and `OVERLEAF_PORT=80`

3. Deploy Application Containers

- Launched the linked services (sharelatex, mongo, and redis) using the Toolkit's wrapper script "bin/up -d".
- Configured the host firewall (UFW) to allow external HTTP traffic on Port 80, exposing the application to the public internet.

4. Access and Admin Creation

- Confirmed the application was accessible in a web browser at the public IP and port (<http://104.236.74.225>).
- Deleted the Droplet (which is why the link might not work anymore) to avoid any unnecessary billing.

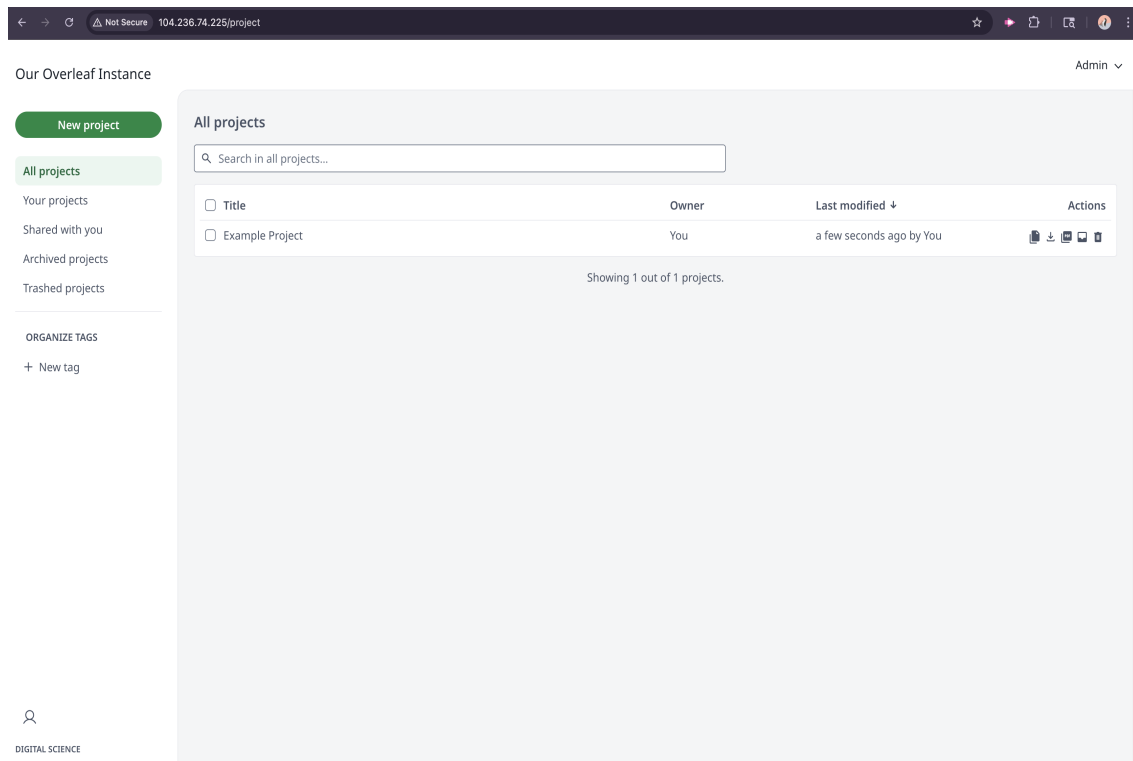

Figure 8.1: Overleaf Instance Main Menu Screenshot

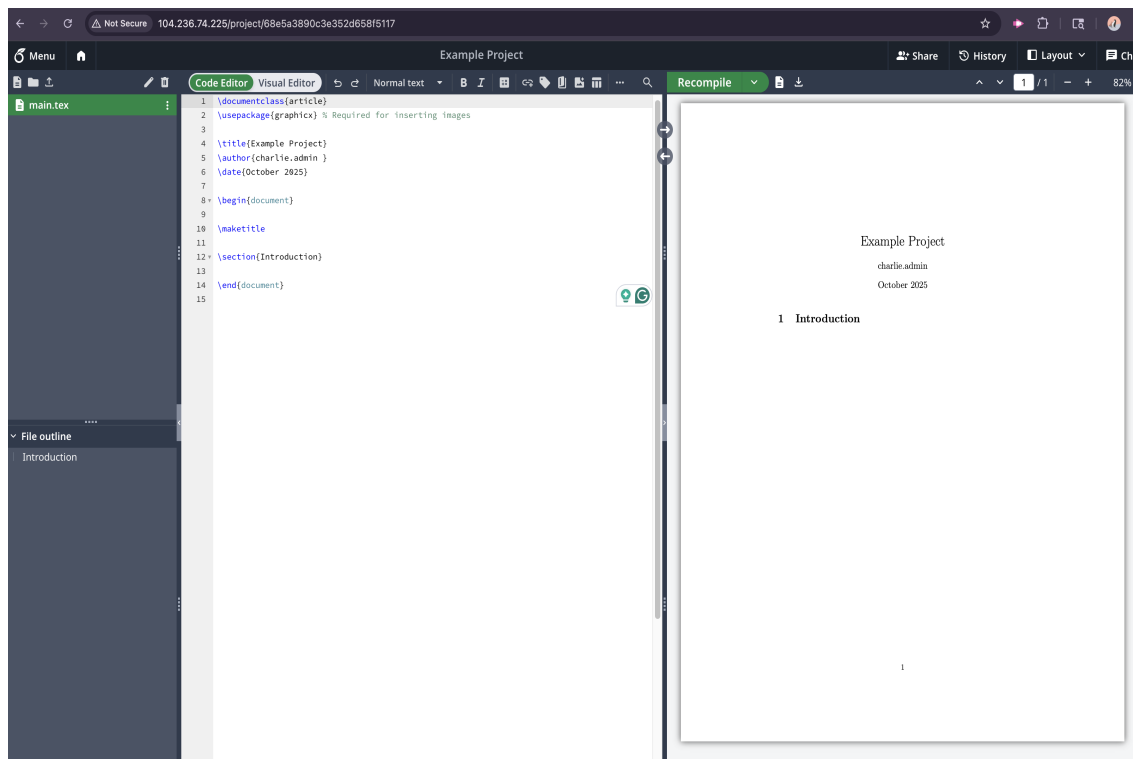

Figure 8.2: Overleaf Instance Example Project Screenshot

Chapter 9

Domain Names, SSL, and Versioning

– Charles, Justin, Benedict, Jacky

9.1 Domain Registration

1. Our team registered the domain `https://latex.ssw590group11overleaf.me` using Namecheap.
2. We received a free domain through our GitHub Student Developer pack and signed up at this website `https://nc.me`.
3. We then hosted this domain using GitHub Pages.
4. This domain was also linked to the Overleaf container we created using the DigitalOcean droplet.

9.2 SSL Configuration

The choice we made for providing SSL to the domain is using Let's Encrypt.

```
# Install Certbot
apt install -y certbot python3-certbot-nginx

# Stop Overleaf temporarily
cd /opt/overleaf/toolkit
bin/stop

# Get SSL certificate (replace with your domain)
certbot certonly --standalone -d your-domain.com

# Update config/overleaf.rc
OVERLEAF_SITE_URL=https://your-domain.com
OVERLEAF_PORT=443

# Configure SSL in config/overleaf.yml
# Then restart
bin/start
```

9.3 Overleaf Container LaTeX Packages Configuration

- In order for our Overleaf to support all LaTeX packages one might use in their document, the commands below must be used to install all LaTeX packages.

```
bin/docker-compose exec sharelatex bash
tlmgr update --self
tlmgr install scheme-full
```

9.4 Overleaf–GitHub Sync

Overleaf's paid Git integration feature is unavailable for free users, so synchronization is currently being replicated manually using Git commands. The workflow allows us to update Overleaf projects locally and push them to GitHub for version tracking.

Repo: <https://github.com/CharlesVilla68/Overleaf590.git>

1. Head to the GitHub site and create a new repository
 2. Generated SSH key on the server
 3. Added the SSH key to GitHub
 4. Verified SSH connection to confirm that the server could communicate with GitHub
 5. Cloned the GitHub repository into the `"/opt/latex-projects/"` directory
 6. Downloaded the project from Overleaf as a ZIP file and uploaded it to the server using `"scp"`
 7. Committed and pushed to GitHub by extracting the files, staging them, and then committing/pushing to GitHub to sync everything
- We used these commands below in the terminal to create and push all the Overleaf files to the repository we created

```
git init
git remote add origin https://github.com/CharlesVilla68/Overleaf590.git
git add .
git commit -m "First commit"
git push -u origin main
```

9.5 Overleaf Project Local Compilation

- In order to compile our Overleaf project locally, we used these commands below.

```

cd /opt/overleaf/toolkit
bin/docker-compose exec sharelatex bash -c "mkdir -p /tmp/compile && rm -rf
↳ /tmp/compile/*"
bin/docker-compose cp /opt/latex-projects/Overleaf590/2025F_SSW590_11/.
↳ sharelatex:/tmp/compile/
bin/docker-compose exec sharelatex bash -c "cd /tmp/compile && pdflatex
↳ -interaction=nonstopmode itManual.tex"
bin/docker-compose cp sharelatex:/tmp/compile/itManual.pdf
↳ /opt/latex-projects/Overleaf590/2025F_SSW590_11/
ls -lh /opt/latex-projects/Overleaf590/2025F_SSW590_11/itManual.pdf
scp root@159.65.44.227:/opt/latex-projects/Overleaf590/2025F_SSW590_11/itMa
↳ nual.pdf ./

```

Figure 9.1: After Compiling in Command Line

9.6 GitHub Version Hash Key Titling

To map each document version to a Git commit, versioning will be added to the document title once the sync process is finalized. This ensures full traceability between the Overleaf PDF and the GitHub repository version.

1. Retrieved the commit hash by using "git log -1 --format=%h" to get the short version of the latest GitHub commit hash

2. Modified the LaTeX title to include the commit hash in the document title
3. Recompiled and pushed the updated LaTeX file to GitHub

Chapter 10

GitHub Actions

– Charles, Justin, Benedict, Jacky

10.1 GitHub Actions Configuration

1. Using the Overleaf instance and GitHub repository we created in our Domain Names chapter
2. Create a new folder in the project named `.github/workflows`
3. In that folder, create a `.yml` file which will contain the actions we want to use
4. Push this file to the repo
5. Make changes to the Overleaf document and push them to the repository
6. Check build status for successful compilation

Our yml file

```
name: Compile LaTeX Documents
```

```
permissions:
```

```
  contents: write # This allows the action to push changes back
```

```
on:
```

```
  push:
